MED 606: Principles of Translational Medicine-Inflammatory Infectious Disease

This course will examine the preclinical and clinical aspects of selected chronic inflammatory and acute infectious diseases with respect to defining the clinical problem, research challenges, and future directions. Diseases to be discussed will include allergy/asthma, various infectious diseases, and inflammatory bowel disease. The syllabus includes a mix of lectures and current topic discussions for students to present recent advances in these areas. This course is designed to align graduate students with the current trends in modern medical training and be effective “translators of discovery and knowledge”.
